

Chapter 7

Network Security

A note on the use of these ppt slides:

We're making these slides freely available to all (faculty, students, readers). They're in powerpoint form so you can add, modify, and delete slides (including this one) and slide content to suit your needs. They obviously represent a *lot* of work on our part. In return for use, we only ask the following:

- If you use these slides (e.g., in a class) in substantially unaltered form, that you mention their source (after all, we'd like people to use our book!)
- If you post any slides in substantially unaltered form on a www site, that you note that they are adapted from (or perhaps identical to) our slides, and note our copyright of this material.

Thanks and enjoy! JFK/KWR

2002.

Network Security 7-1

Chapter 7: Network Security

Chapter goals:

- understand principles of network security:
 - cryptography and its *many* uses beyond "confidentiality"
 - authentication
 - message integrity
 - key distribution
- security in practice:
 - firewalls
 - security in application, transport, network, link layers

Network Security 7-2

Chapter 7 roadmap

- 7.1 What is network security?
- 7.2 Principles of cryptography
- 7.3 Authentication
- 7.4 Integrity
- 7.5 Key Distribution and certification
- 7.6 Access control: firewalls
- 7.7 Attacks and counter measures
- 7.8 Security in many layers

What is network security?

Confidentiality: only sender, intended receiver should “understand” message contents

- sender encrypts message
- receiver decrypts message

Authentication: sender, receiver want to confirm identity of each other

Nonrepudiation: neither the sender nor the receiver of a message be able to deny the transmission

Message Integrity: sender, receiver want to ensure message not altered (in transit, or afterwards) without detection

Access and Availability: services must be accessible and available to users

Security attacks

Normal flow:

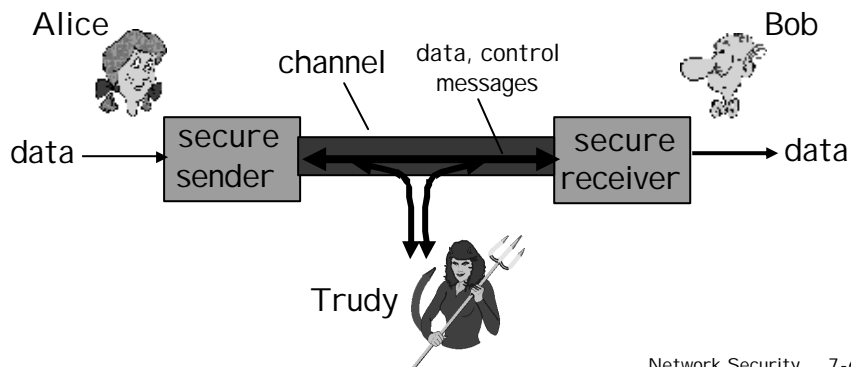

- ❑ Interruption
 - Availability
- ❑ Interception
 - Confidentiality
- ❑ Modification
 - Integrity
- ❑ Fabrication
 - Authenticity

Network Security 7-5

Friends and enemies: Alice, Bob, Trudy

- ❑ well-known in network security world
- ❑ Bob, Alice (lovers!) want to communicate “securely”
- ❑ Trudy (intruder) may intercept, delete, add messages

Network Security 7-6

There are bad guys (and girls) out there!

Q: What can a “bad guy” do?

A: a lot!

- *eavesdrop*: intercept messages
- actively *insert* messages into connection
- *impersonation*: can fake (spoof) source address in packet (or any field in packet)
- *hijacking*: “take over” ongoing connection by removing sender or receiver, inserting himself in place
- *denial of service*: prevent service from being used by others (e.g., by overloading resources)

more on this later

Internet security threats

Packet sniffing:

- broadcast media
- promiscuous NIC reads all packets passing by
- can read all unencrypted data (e.g. passwords)
- e.g.: C sniffs B's packets

Internet security threats

IP Spoofing:

- can generate "raw" IP packets directly from application, putting any value into IP source address field
- receiver can't tell if source is spoofed
- e.g.: C pretends to be B

Network Security 7-9

Internet security threats

Denial of service (DOS):

- flood of maliciously generated packets "swamp" receiver
- Distributed DOS (DDOS): multiple coordinated sources swamp receiver
- e.g., C and remote host SYN-attack A

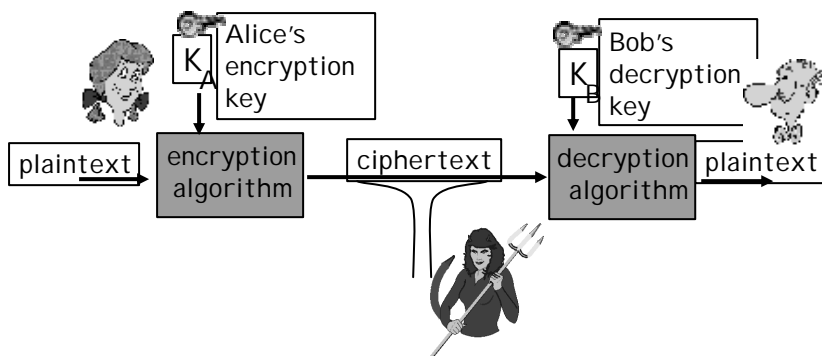

Network Security 7-10

Chapter 7 roadmap

- 7.1 What is network security?
- 7.2 Principles of cryptography
- 7.3 Authentication
- 7.4 Integrity
- 7.5 Key Distribution and certification
- 7.6 Access control: firewalls
- 7.7 Attacks and counter measures
- 7.8 Security in many layers

Network Security 7-11

The language of cryptography

symmetric key crypto: sender, receiver keys *identical*
public-key crypto: encryption key *public*, decryption key *secret* (private)

Network Security 7-12

Symmetric key crypto: DES

DES: Data Encryption Standard

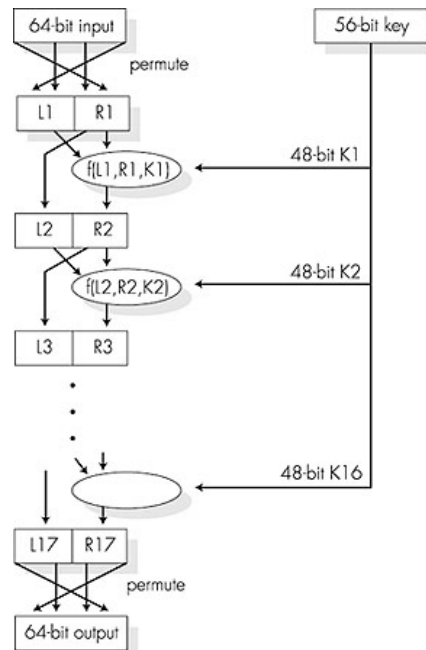

- ❑ US encryption standard [NI ST 1993]
- ❑ 56-bit symmetric key, 64-bit plaintext input
- ❑ How secure is DES?
 - DES Challenge: 56-bit-key-encrypted phrase (“Strong cryptography makes the world a safer place”) decrypted (brute force) in 4 months
 - no known “backdoor” decryption approach
- ❑ making DES more secure:
 - use three keys sequentially (3-DES) on each datum
 - use cipher-block chaining

Network Security 7-15

Symmetric key crypto: DES

DES operation

initial permutation
16 identical “rounds” of function application, each using different 48 bits of key
final permutation

Network Security 7-16

Public Key Cryptography

symmetric key crypto

- ❑ requires sender, receiver know shared secret key
- ❑ Q: how to agree on key in first place (particularly if never "met")?

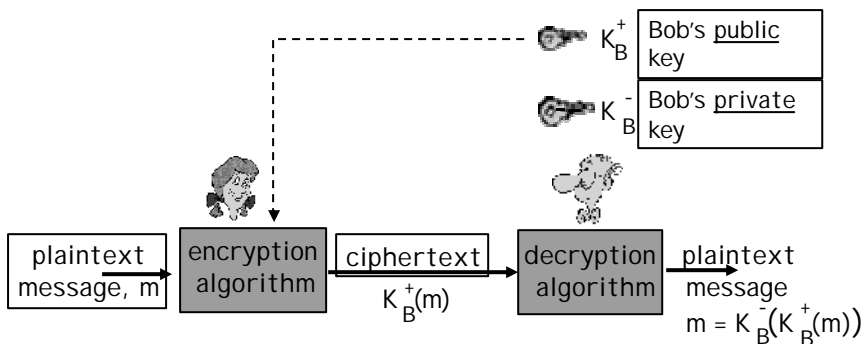

public key cryptography

- ❑ radically different approach [Diffie-Hellman76, RSA78]
- ❑ sender, receiver do *not* share secret key
- ❑ *public* encryption key known to *all*
- ❑ *private* decryption key known only to receiver

Network Security 7-17

Public key cryptography

Network Security 7-18

Public key encryption algorithms

Requirements:

- ① need $K_B^+(\cdot)$ and $K_B^-(\cdot)$ such that
$$K_B^-(K_B^+(m)) = m$$
- ② given public key K_B^+ , it should be impossible to compute private key K_B^-

RSA: Rivest, Shamir, Adelson algorithm

Network Security 7-19

RSA: Choosing keys

1. Choose two large prime numbers p, q .
(e.g., 1024 bits each)
2. Compute $n = pq, z = (p-1)(q-1)$
3. Choose e (with $e < n$) that has no common factors with z . (e, z are "relatively prime").
4. Choose d such that $ed-1$ is exactly divisible by z .
(in other words: $ed \bmod z = 1$).
5. *Public* key is (n,e) . *Private* key is (n,d) .
$$\underbrace{\hspace{1.5cm}}_{K_B^+} \qquad \underbrace{\hspace{1.5cm}}_{K_B^-}$$

Network Security 7-20

RSA: Encryption, decryption

0. Given (n,e) and (n,d) as computed above
1. To encrypt bit pattern, m , compute
 $c = m^e \bmod n$ (i.e., remainder when m^e is divided by n)
2. To decrypt received bit pattern, c , compute
 $m = c^d \bmod n$ (i.e., remainder when c^d is divided by n)

Magic happens!

$$m = \underbrace{(m^e \bmod n)}_c^d \bmod n$$

RSA example:

Bob chooses $p=5, q=7$. Then $n=35, z=24$.
 $e=5$ (so e, z relatively prime).
 $d=29$ (so $ed-1$ exactly divisible by z).

encrypt:	<u>letter</u>	<u>m</u>	<u>m^e</u>	<u>c = m^e mod n</u>
	l	12	1524832	17
decrypt:	<u>c</u>	<u>c^d</u>	<u>m = c^d mod n</u>	<u>letter</u>
	17	481968572106750915091411825223071697	12	l

Chapter 7 roadmap

- 7.1 What is network security?
- 7.2 Principles of cryptography
- 7.3 Authentication
- 7.4 Integrity
- 7.5 Key Distribution and certification
- 7.6 Access control: firewalls
- 7.7 Attacks and counter measures
- 7.8 Security in many layers

Network Security 7-23

Authentication

Goal: Bob wants Alice to “prove” her identity to him

Protocol ap1.0: Alice says “I am Alice”

Failure scenario??

Network Security 7-24

Authentication

Goal: Bob wants Alice to “prove” her identity to him

Protocol ap1.0: Alice says “I am Alice”

in a network,
Bob can not “see”
Alice, so Trudy simply
declares
herself to be Alice

Network Security 7-25

Authentication: another try

Protocol ap2.0: Alice says “I am Alice” in an IP packet containing her source IP address

Failure scenario??

Network Security 7-26

Authentication: another try

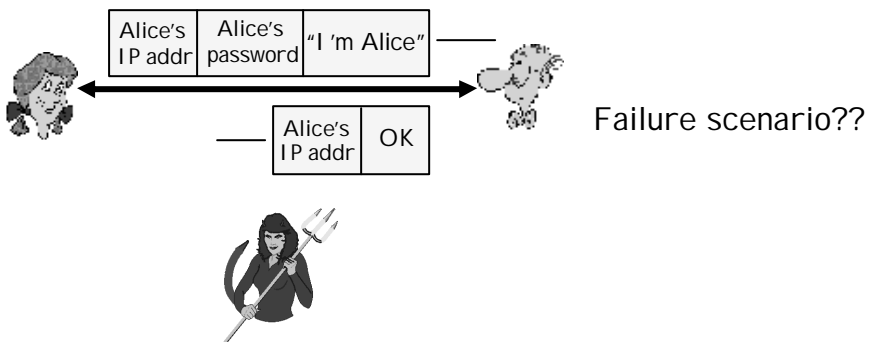

Protocol ap2.0: Alice says "I am Alice" in an IP packet containing her source IP address

Network Security 7-27

Authentication: another try

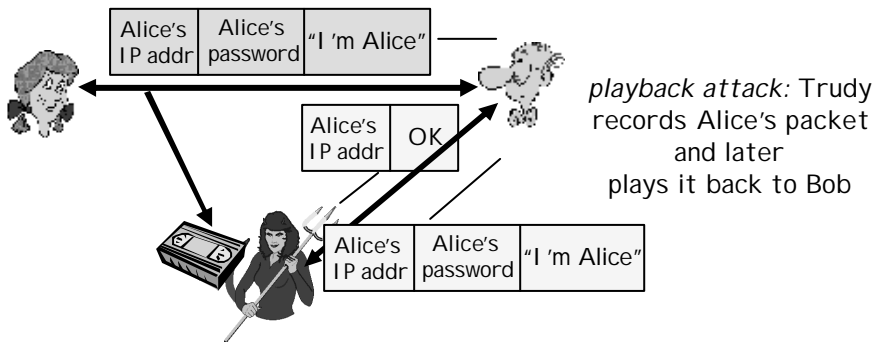

Protocol ap3.0: Alice says "I am Alice" and sends her secret password to "prove" it.

Network Security 7-28

Authentication: another try

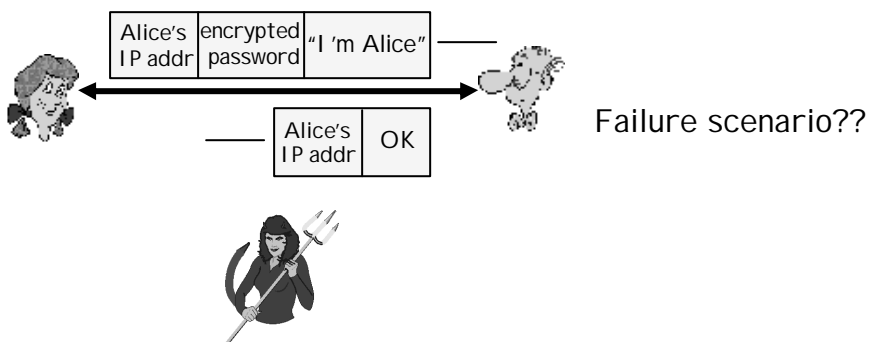

Protocol ap3.0: Alice says "I am Alice" and sends her secret password to "prove" it.

Network Security 7-29

Authentication: yet another try

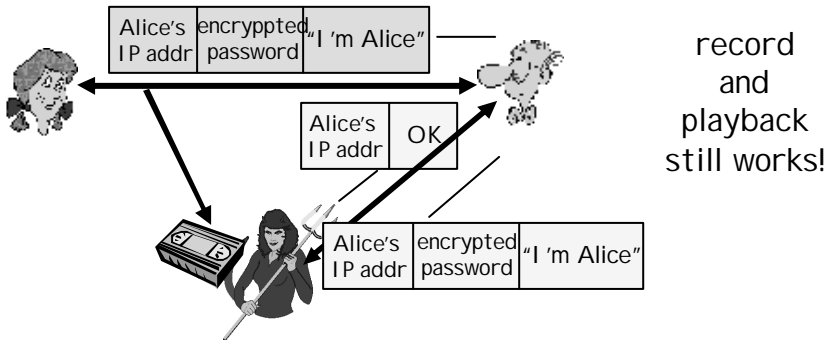

Protocol ap3.1: Alice says "I am Alice" and sends her *encrypted* secret password to "prove" it.

Network Security 7-30

Authentication: another try

Protocol ap3.1: Alice says "I am Alice" and sends her *encrypted* secret password to "prove" it.

Network Security 7-31

Authentication: yet another try

Goal: avoid playback attack

Nonce: number (R) used only *once -in-a-lifetime*

ap4.0: to prove Alice "live", Bob sends Alice nonce, R. Alice must return R, encrypted with shared secret key

Failures, drawbacks?

Network Security 7-32

Authentication: ap5.0

ap4.0 requires shared symmetric key

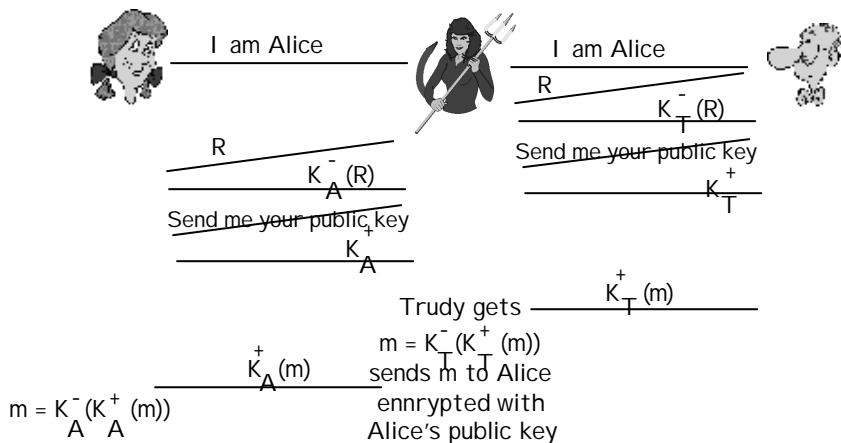

□ can we authenticate using public key techniques?

ap5.0: use nonce, public key cryptography

ap5.0: security hole

Man (woman) in the middle attack: Trudy poses as Alice (to Bob) and as Bob (to Alice)

ap5.0: security hole

Man (woman) in the middle attack: Trudy poses as Alice (to Bob) and as Bob (to Alice)

Difficult to detect:

- ❑ Bob receives everything that Alice sends, and vice versa. (e.g., so Bob, Alice can meet one week later and recall conversation)
- ❑ problem is that Trudy receives all messages as well!

Chapter 7 roadmap

- 7.1 What is network security?
- 7.2 Principles of cryptography
- 7.3 Authentication
- 7.4 Message integrity
- 7.5 Key Distribution and certification
- 7.6 Access control: firewalls
- 7.7 Attacks and counter measures
- 7.8 Security in many layers

Digital Signatures

Cryptographic technique analogous to hand-written signatures.

- ❑ sender (Bob) digitally signs document, establishing he is document owner/creator.
- ❑ verifiable, nonforgeable: recipient (Alice) can prove to someone that Bob, and no one else (including Alice), must have signed document

Network Security 7-37

Digital Signatures

Simple digital signature for message m :

- ❑ Bob signs m by encrypting with his private key K_B^- , creating "signed" message, $K_B^-(m)$

Network Security 7-38

Digital Signatures (more)

- ❑ Suppose Alice receives msg m , digital signature $K_B^-(m)$
- ❑ Alice verifies m signed by Bob by applying Bob's public key K_B^+ to $K_B^-(m)$ then checks $K_B^+(K_B^-(m)) = m$.
- ❑ If $K_B^+(K_B^-(m)) = m$, whoever signed m must have used Bob's private key.

Alice thus verifies that:

- ✓ Bob signed m .
- ✓ No one else signed m .
- ✓ Bob signed m and not m' .

Non-repudiation:

- ✓ Alice can take m , and signature $K_B^-(m)$ to court and prove that Bob signed m .

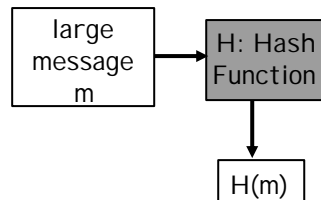

Network Security 7-39

Message Digests

Computationally expensive to public-key-encrypt long messages

Goal: fixed-length, easy-to-compute digital "fingerprint"

- ❑ apply hash function H to m , get fixed size message digest, $H(m)$.

Hash function properties:

- ❑ many-to-1
- ❑ produces fixed-size msg digest (fingerprint)
- ❑ given message digest x , computationally infeasible to find m such that $x = H(m)$

Network Security 7-40

Internet checksum: poor crypto hash function

Internet checksum has some properties of hash function:

- ✓ produces fixed length digest (16-bit sum) of message
- ✓ is many-to-one

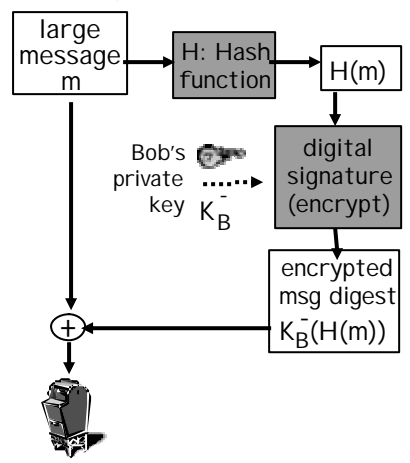

But given message with given hash value, it is easy to find another message with same hash value:

<u>message</u>	<u>ASCII format</u>	<u>message</u>	<u>ASCII format</u>
I O U 1	49 4F 55 31	I O U <u>9</u>	49 4F 55 <u>39</u>
0 0 . 9	30 30 2E 39	0 0 . <u>1</u>	30 30 2E <u>31</u>
9 B O B	39 42 D2 42	9 B O B	39 42 D2 42
	<u>B2 C1 D2 AC</u>		<u>B2 C1 D2 AC</u>

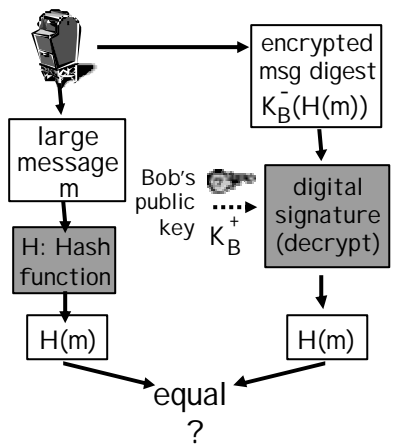

different messages but identical checksums!

Digital signature = signed message digest

Bob sends digitally signed message:

Alice verifies signature and integrity of digitally signed message:

Hash Function Algorithms

- MD5 hash function widely used (RFC 1321)
 - computes 128-bit message digest in 4-step process.
 - arbitrary 128-bit string x , appears difficult to construct msg m whose MD5 hash is equal to x .
- SHA-1 is also used.
 - US standard [NI ST, FIPS PUB 180-1]
 - 160-bit message digest

Chapter 7 roadmap

- 7.1 What is network security?
- 7.2 Principles of cryptography
- 7.3 Authentication
- 7.4 Integrity
- 7.5 Key distribution and certification
- 7.6 Access control: firewalls
- 7.7 Attacks and counter measures
- 7.8 Security in many layers

Trusted Intermediaries

Symmetric key problem:

- ❑ How do two entities establish shared secret key over network?

Solution:

- ❑ trusted key distribution center (KDC) acting as intermediary between entities

Public key problem:

- ❑ When Alice obtains Bob's public key (from web site, e-mail, diskette), how does she know it is Bob's public key, not Trudy's?

Solution:

- ❑ trusted certification authority (CA)

Network Security 7-45

Key Distribution Center (KDC)

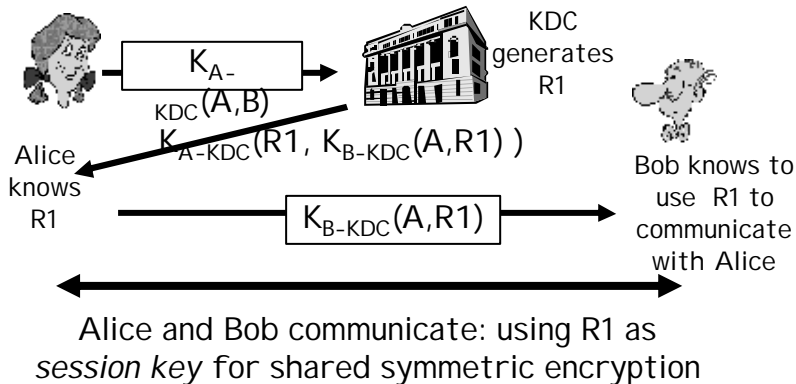

- ❑ Alice, Bob need shared symmetric key.
- ❑ KDC: server shares different secret key with *each* registered user (many users)
- ❑ Alice, Bob know own symmetric keys, K_{A-KDC} K_{B-KDC} , for communicating with KDC.

Network Security 7-46

Key Distribution Center (KDC)

Q: How does KDC allow Bob, Alice to determine shared symmetric secret key to communicate with each other?

Network Security 7-47

Certification Authorities

- Certification authority (CA): binds public key to particular entity, E.
- E (person, router) registers its public key with CA.
 - E provides "proof of identity" to CA.
 - CA creates certificate binding E to its public key.
 - certificate containing E's public key digitally signed by CA
 - CA says "this is E's public key"

Network Security 7-48

Certification Authorities

- When Alice wants Bob's public key:
 - gets Bob's certificate (Bob or elsewhere).
 - apply CA's public key to Bob's certificate, get Bob's public key

Network Security 7-49

A certificate contains:

- Serial number (unique to issuer)
- info about certificate owner, including algorithm and key value itself (not shown)

- info about certificate issuer
- valid dates
- digital signature by issuer

Network Security 7-50
